

Operator App at Zattoo

Example of an OpApp implementation
For HbbTV Symposium

All details can be found in our OpApp White Paper

<https://thetvplatform.zattoo.com/hbbtv-opapp-contact/>

WHITEPAPER

HbbTV OpApp

A unified, operator branded
experience on Smart TVs

thetvplatform.zattoo.com

Netzwerk Verbindung

Stellen Sie eine Netzwerkverbindung her, um eine Reihe von Funktionen nutzen zu können, die über das Internet oder das Heimnetzwerk verfügbar sind.

- Für eine kabellose Verbindung stellen Sie wireless Netzwerk ein.
- Für kabelgebundene durch ein Ethernet

Bitte warten.

Wählen Sie 'Auto' nach der Einrichtung einer Netzwerkumgebung.

Auto

Manuell

Später einstellen

Wählen Sie 'Auto' für einfache automatische Festlegung der Einstellungen.

Zattoo OpApp - Facts

- The OpApp is the only version of the Zattoo all on those devices
- Available on Panasonic 2020 Models and up
- Zattoo did not receive any negative user feedback since the launch in September 2020
- Development Effort Estimate: Roughly 2 sprints for one engineer

How to build an operator app?

-

**Implementation at Zattoo
based on existing OTT app**

Checklist - Preparation

- DVB Services Org ID (MHP) - for identifying the app

Dev environment

- Get a TV with a special dev firmware
- Reference application
- API docs and technical specification
- Panasonic team is able to provide all from above

pavel_2@MacBook-Pro-4 web-tv %

UNDER THE HOOD

Shall match the organisation_id in the XML AIT during discovery.

Note: To register a globally unique organisation_id, operators should apply for an MHP Organisation ID at <https://dvbservices.com>. Here is a list of already allocated identifiers: https://www.dvbservices.com/identifiers/mhp_organisation_id.

Checklist - Package the app

- Create opapp.zip file with HTML/CSS/JS/images assets
- Add XML AIT file (Required for a production launch)
- Encrypt the package and host it (Required for a production launch)
- Share URL with Panasonic (Required for a production launch)

Checklist - App Start Experience

- Implement Loader UI
- Initialize TV APIs based on reference example

Checklist - Settings

- Add event listener in the app code
- Make Settings UI available for both authenticated and anonymous users

Checklist - Offline Mode

- Implement check for network connectivity
- Add UI to display offline status

Checklist - Uninstall

- ❑ Extend app settings with Uninstall option
- ❑ Implement method to clean up user data and delete the app via API
- ❑ Add event listener

Checklist - Additional Hardkeys on the Remote Control

- Request additional keys via provided by Panasonic API
- Register event listeners in the app code

Checklist - HbbTV

- ❑ Add event listener for Red button
- ❑ Map channel ID to HbbTV app URL
- ❑ Add method to create/close HbbTV apps based on provided API

HbbTV on Android TV

The Zattoo & Fraunhofer Fokus project to make an already smart device even smarter.

Franziska Kleemann, Zattoo

Android TV for Operator Tier @Zattoo

Android TV for Operator Tier at Zattoo

01. Reliable Hardware

Currently 3 supported platforms from 2 different manufacturers

02. Powerful Operating System

Utilising all advantages of the Android system...

03. Custom Launcher

...while still providing a custom TV experience in the operator's look & feel

ATV Custom Launcher

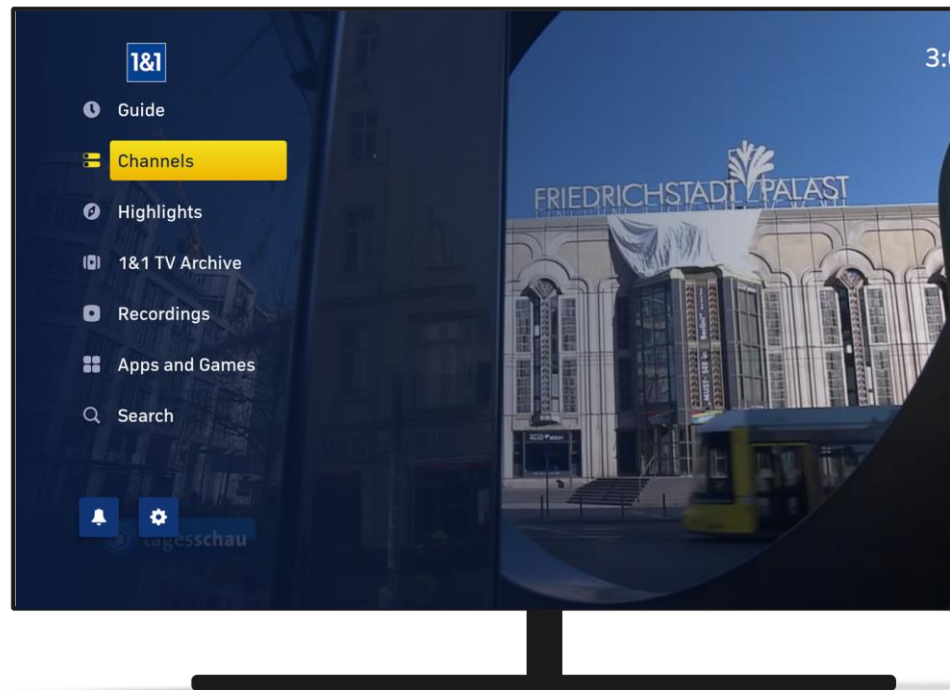

Custom Launcher operates as the intermediate layer between the OS and the TV experience

Adding launcher specific features like: access to system settings, notifications and the apps & games section

Additional features within the TV experience, e.g. : local recordings, login via serial number and HbbTV

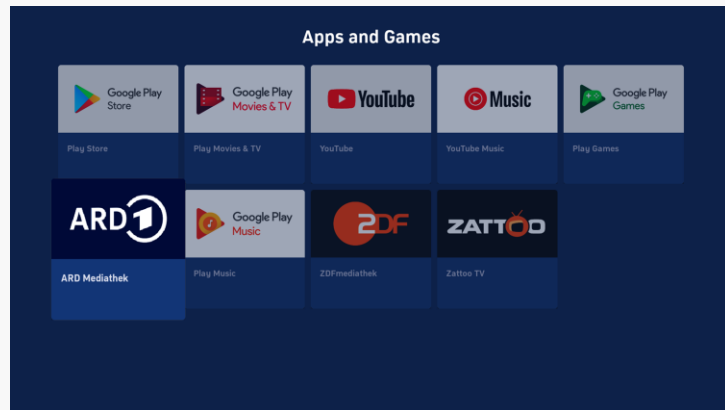

HbbTV in our ATV Custom Launcher

HbbTV on an already connected device?

HbbTV red button prompt

- Accessible via one click
- Smooth experience: no need to install & launch a separate app
- Live content related messages & features

vs. Access to media library apps

- Accessible via three clicks
- Installation needs to be actively triggered by the user
- Content displayed independently from currently running program

Adding the HbbTV feature to our ATV product

A joint project by

Research

Getting an overview of available HbbTV apps & their features

Design

Defining the MVP, the architectural design and interfaces between the library and the custom launcher application

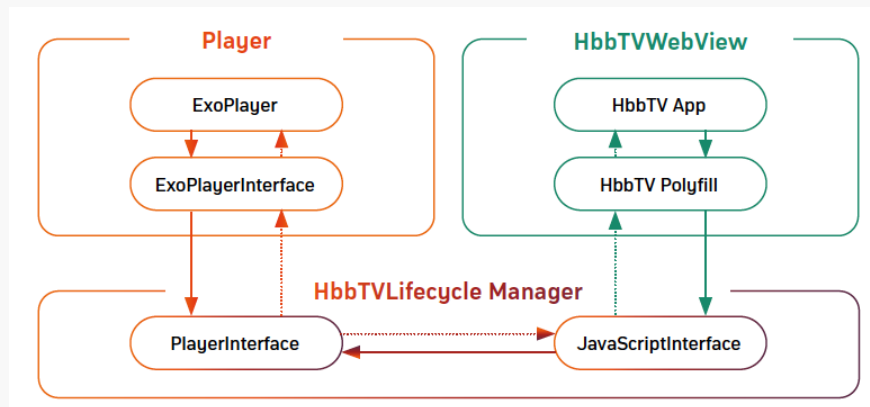

Implementation

Implementing the HbbTV library provided by Fraunhofer Fokus, handling RCU keys, navigation & lifecycle

Technical approach

- Main component of the library: **HbbTV WebView** as an extension of the Android System WebView
- **HbbTVLifecycle Manager** monitors & controls life cycle of running HbbTV applications, acting as a bridge between the WebView and the player
- Library can be used with any player - in our case: the **ExoPlayer**. Communication between the player and the HbbTV apps is managed via the **PlayerInterface**

User facing features

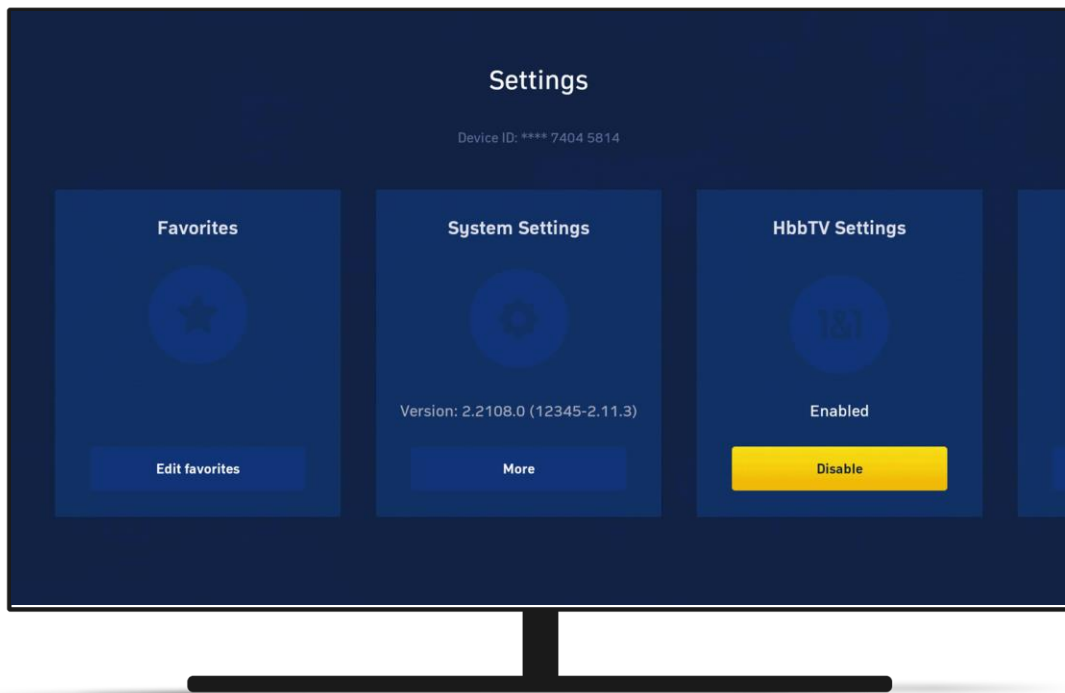

Currently supported features: e.g. VOD libraries, parental control, games, broadcast PiP video playback

Feature toggle within settings allows user to turn the whole HbbTV feature on/off

Navigation concept uses coloured buttons, D-pad, back and OK button

Support of HbbTV 2.0

Currently supported standard = HbbTV 1.5
Future iterations might look into the 2.0 standard

Expansion to Android TV apps

Currently available in our Android TV Custom Launcher, the HbbTV feature could - in theory - also be enabled in our other ATV applications

Dynamic Signaling

Switching to a dynamic approach of loading HbbTV URLs

Thank you!
